

Laminar Benchtop

Carefully Directed Airflow

Intake air passes through a 1.0" (2.5cm) fiberglass prefilter. The blower/motor unit moves the air through a zero-probed, HEPA filter rated at 99.99% efficient for 0.3 micron particulates.

The HEPA filtered air is then directed horizontally across the work surface. Positive pressure, unidirectional laminar airflow prevents any inflow of room air contaminants onto the work surface.
